PRESS RELEASE

Efficient valorisation of CO2 and bio-waste for longterm energy storage using a microwave plasma torch and quenching using the reverse Boudouard reaction

Intermediate technical deadline

Once the design has been considered mature enough an unofficial design review was performed to decide what would be the next steps. The outline of the upper part of the master prototype (including the induction unit) was declared closed and so the rest of items, like the supporting structure for the torch and the expansion chamber, detailed definition began.

The objective was clear, to close the overall size of the assembly to start thinking in the procurement of the different parts for the Antwerpen and Sttutgart prototypes.
